Summary

The Diabetic Retinal screening program to be undertaken by the ROOM project will allow screening in the patient's home town. The screening is undertaken using a hand held retinal camera to obtain pictures of the patient's retina.

Key dates

Jan 2017

Jun 2018

Implementation sites

Darling Downs Hospital and Health Service

Key Contacts

Aim

To detect sight-threatening disease in earlier stages of Diabetic Retinopathy

Benefits

ROOM enables the early detection and treatment of diabetic retinopathy in rural areas where access to screening is an issue.

Background

Diabetic retinopathy is among the most common causes of vision loss in the working age population. Early and regular screening to detect diabetic retinopathy and associated conditions has been demonstrated to reduce significant vision loss and disability.

Solutions Implemented

Eye Screening with a hand held camera that takes picture of the patient's retina will be undertaken in a patient's home town. The pictures are then reviewed by a specialist using a store and forward method of telehealth.
