Summary

The Cannulation Reduction in Emergency Department Implementation Toolkit (CREDIT) initiative uses a multimodal educational intervention aimed at reducing insertion of unnecessary, "just in case" Peripheral Intravenous Catheters/Cannulas (PIVCs). CREDIT centres on a simple message for clinicians: "Are you 80 per cent sure that the cannula will be used in your hemodynamically stable patient within the next 24 hours?" or more commonly "Are you 80 per cent sure?".

Key dates

Aug 2017

Jun 2020

Implementation sites

Royal Brisbane and Women's Hospital

Partnerships

Griffith University, Prince Charles Hospital

Key Contacts

Tracey Hawkins

0042

paul.blee@hiu

Senior Clinical Research Nurse and Initiative Lead, RBWH

PROV-ED Project – Healthcare Improvement Unit (HIU) – Clinical Excellence Queensland (CEQ)

(07) 3646 5005

PROVED.Project@health.qld.gov.au

Aim

The aim of CREDIT is to reduce insertion of unnecessary PIVCs.

Benefits

- Empowering staff and promoting clinical decision making.
- Reducing risk of hospital associated infection.
- Avoiding unnecessary pain for patients.
- Cost savings.

Background

The CREDIT Initiative Lead is Tracey Hawkins, Senior Clinical Research Nurse at the Emergency Trauma Centre (ETC), Royal Brisbane and Women's Hospital (RBWH), Metro North HHS. The insertion of PIVCs is the most common invasive medical procedure worldwide, however research indicates that only half PIVCs inserted in the ED are used. Unused "just in case" PIVCs constitute low value care as they provide no benefit to the patient, cause pain, and increase the risk of bloodstream infection. Studies indicate that PIVC-related *Staphylococcus Aureus* Bacteraemia (SAB) represents up to 25 per cent of all healthcare-associated SAB episodes.

Solutions Implemented

Improvements in cannulation behaviours were achieved by:

- Education and training
- Clinical change champions and advertising
- Surveillance and feedback

Evaluation and Results

Following CREDIT implementation, the RBWH Emergency Trauma Centre reduced the number of PIVCs inserted by 9.8 per cent and increased the PIVC utilisation rate by 13 per cent. This equated to a cost saving of \$4,718 over a two-week period. The cost saving does not include cost of adverse events resulting from unnecessary PIVC insertion.
